

Profile

Senior engineer with broad full-stack experience and growing responsibilities in system design. Comfortable shaping service boundaries and delivery pipelines, with hands-on coding across React and Node.js. Seeking a step into a formal architecture role while continuing to contribute to implementation.

Core Skills

Architecture
Service decomposition, API design, basic C4 diagrams, pragmatic layering

Front End
React, TypeScript, some Next.js (SSR), design tokens, Storybook

Back End
Node.js (Express/Fastify), REST, basic GraphQL, background jobs

Cloud/Infra
AWS (ECS/Lambda), Azure Functions, Docker, GitHub Actions

Security
OWASP Top 10 awareness, secrets management basics, auth flows (OIDC)

Data
Postgres, MySQL, Redis caching, queue semantics (SQS)

API First CI/CD Pipelines Observability Basics Cost Awareness

Selected Tools

- React, Next.js (foundational), TypeScript
- Express, Fastify, Nest (intro level)
- Postgres, Prisma, Knex
- AWS: ECS, Lambda, SQS · Azure: Functions, Key Vault
- Terraform (modules), Docker
- GitHub Actions, Dependabot
- Prometheus/Grafana (dashboards), basic OpenTelemetry
- Trivy, npm audit, Semgrep (starter rules)

Education & Certs

- B.Sc. (Software Engineering)** · University of South Australia
- AWS Certified Developer – Associate
 - Microsoft AZ-104 (in progress)
 - OWASP Top 10 Workshop (internal)

Experience

Senior Full-Stack Engineer

HarborWave · SaaS for Operations

2022–Present · Adelaide (Hybrid)

- Implemented React/TypeScript front-end features and contributed to an initial Next.js SSR rollout for public pages.
- Designed and built RESTful Node.js services with Postgres; introduced request validation and idempotency keys.
- Helped containerise services and set up blue/green deployments on ECS; wrote GitHub Actions for basic CI.
- Worked with a staff architect to sketch C4 diagrams and draft early API contracts; created a lightweight style guide.
- Participated in quarterly security reviews, remediating findings from npm audit and container scans (Trivy).
- Collaborated with product and support to capture non-functional requirements (availability targets, rate limits).

Impact: Reduced average response time ~18%; feature lead time improved ~22% after pipeline tuning.

Software Engineer

SouthBridge Labs · Product Delivery

2019–2022 · Melbourne (Remote)

- Built user-facing React modules and Express APIs; introduced pagination and caching to reduce DB load.
- Migrated background workers to SQS with dead-letter queues; added metrics and alerts via CloudWatch.
- Contributed to documentation and ADR drafts for data retention and logging approaches (co-author).

Role Fit Matrix

Job Requirement	Evidence
Lead End-to-End Architectural Design	Partnered with staff architect on service boundaries and initial cloud topology; led technical spikes but not full end-to-end ownership.
Establish Design Patterns & Standards	Helped shape API guidelines and folder conventions; authored a starter component guide. Standards enforcement largely handled by seniors.
Security & Threat Assessments	Participated in risk reviews and basic STRIDE discussions; implemented fixes (rate limiting, input validation). Formal threat modeling led by security.
Build & Deploy (React/Next, Node, Python)	Strong in React/Node; shipped small Python utilities (scripts for data import). Limited exposure to advanced Next.js features.
Cross-Functional Collaboration	Regularly partnered with product and ops on scope and release plans; facilitated handoffs and wrote run notes.
Document & Communicate Decisions	Co-authored ADRs for logging and auth flows; maintained API changelogs and onboarding notes.
Govern Technical Implementation	Performed peer reviews and lint rule updates; periodic checklists in PRs. Formal audits and policy gates owned by architecture team.

Selected Architecture Decisions (ADRs)

- ADR-009:** Standardise request validation layer using Zod; consistent 4xx/5xx envelopes.
- ADR-015:** Adopt SQS with DLQs for asynchronous processing; backoff strategy documented.

Recent POCs & Utilities (Hands-On)

- Next.js SSR Pilot:** Prototyped SSR for marketing pages; set cache headers and basic CDN rules.
- Node.js Rate Limiter:** Lightweight middleware using Redis counters; deployed to two services.
- Python Import Script:** CSV-to-Postgres loader with schema checks and rollback on failure.
